

How your Vendor Status Digest works

What arrives

Once every 24 hours, after our daily poll, one message is posted to the webhook you gave at checkout. It lists every incident on your vendors' public status pages that was opened, updated or resolved since the previous digest, with the vendor's own title, impact level and a link. Vendors still degraded or in maintenance are repeated until they recover. On a quiet day you get a one-line 'all quiet' message, so silence never means broken.

First message

The first digest starts with the vendors that matched our map and any names that did not. If something did not match, reply to your Gumroad receipt with the vendor's status-page address and we will correct it.

Honesty rule

A vendor we cannot read is reported as 'cannot see', never as operational. Some large vendors publish no machine-readable status page at all; they are listed on the coverage page and will always show as 'cannot see'.

What it is not

A daily digest, not minute-level paging. For 5-minute alerts, use the free open-source template - it runs inside your own GitHub Actions minutes. The hosted 5-minute watch will be sold separately only once we can run it ourselves.

Formats

Slack incoming webhooks get Block Kit sections; Discord webhooks get an embed; Microsoft Teams (Workflows or connector) gets an Adaptive Card; any other https address receives plain JSON with a 'text' field and the structured digest.

Privacy

Your webhook URL is read from Gumroad each morning when the digest is sent and is never stored or published by us. Gumroad holds your email address; we do not.

Refunds

Full refund within 14 days for any reason - reply to your Gumroad receipt. After 14 days, a pro-rata refund if digests stop arriving for 7 consecutive days through our fault.
